//dreft CGAP_CH1 is a cDNA library containing the following
tissue(s): Chondxosarcoma Grade II. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oligo-dT primer containing a
Not I site. Double stranded cDNA was ligated to an Ecok I
adaptor, diseated with Not I, and cloned directionally
into pT7T3-Pac vector. The oligonucleotide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
(dT) 18 tail. The sequence tag for this library is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5123

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Then invention relates to a new combination comprising 55 cDNAs (ADA24485 -ADA24539) or their complements that are differentially regulated in an adipose sample. Also included are detecting differential expression of one or more cDNAs in a sample containing nucleic acids, screening several molecules or compounds to identify a ligand that specifically binds a cDNA, a vector comprising the cDNA, a host call containing the vector, producing a protein, screening several molecules or compounds, producing
                                                                                                                         Human cDNA differential expressed in adipose tissue, INCYTE063646CB1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New combination comprising several cDNAs, useful for preparing a composition for diagnosing or treating diabetes mellitus, obesity, hypertension, atherosclerosis, or cancer of the breast, prostate or colon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 39-40; 84pp; English.

an antibody and the isolated antibody. The cDNAs comprise sequences which are upregulated or downregulated in response to peroxisome proliferator-activated receptor gamma (PPARgamma) agonist. The combination comprising several cDNAs is useful for preparing a composition for diagnosing or treating diabetes mellitus, obesity, hypertension, atherosclerosis, cancer of the breast, prostate or colon, or polycystic ovarian syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cancer-associated nucleic acid molecules (N) and proteins (P), where the cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Additionally and AAB77789 represent sequences used in the examplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SBQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0

Human precursor plasminogen activator inhibitor (PAI-2) having specified amino acid sequence and human mature PAI2 (23(5) to 415(P)) sequences are claimed. Fure DNA coding for human precursor PAI-2 and human mature PAI-2, a transfer vector pcD1214 as available in E. coli HB101 (pcD1214) (NRRL B-18161), transformed host cells (mammalian and yeast), and a method of culturing the transformed calls to produce PAI-2 are claimed. PAI-2 may have utility as a substitute for epsilon-aminocaproic acid (epsilon-ACA). The PAI-2 gene can be used as a probe to locate the gene coding for a PAI-2 or PAI-2-like activity. The PAI-2 can also be used to produce antibodies used in diagnostic assays. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        131 CABARGCARGCCCACCAGARCCTCTTCCTCTCCCCATGGAGCATCTCGTCCATGG

                                                                                                                                                                           The sequence was obtd. from the combined sequences of lambda PAI-75.1 lambda PAI75.15, both isolated from a placental cDNA library. A recombinant vector contg. the DNA can be used to express PAI-2 which inhibits the conversion of plasminogen to plasmin and is used as an anticoagulant. (Updated on 25-MAR-2003 to correct PA field.)
